2.7	Template Router	25
3	Indices and tables	35
	Python Module Index	37

`zenossapi` is a python module for interacting with the Zenoss API an an object-oriented way. The philosophy here is to use objects to work with everything in the Zenoss API, and to try to normalize the various calls to the different routers. Thus *get* methods will always return an object, *list* methods will return data. All methods to add or create start with *add*, all remove or delete start with *delete*. As much as possible the methods try to hide the idiosyncrasies of the JSON API, and to do the work for you, for example by letting you use a device name instead of having to provide the full device UID for every call.

1.1 apiclient Class

Zenoss API Client Class

class zenossapi.apiclient.**Client** (*host=None, user=None, password=None, ssl_verify=None*)

Bases: object

Client class to access the Zenoss JSON API

get_router (*router*)

Instantiates and returns a Zenoss router object

Parameters **router** (*str*) – The API router to use

get_router_methods (*router*)

List all available methods for an API router

Parameters **router** (*str*) – The router to get methods from

Returns

Return type list

get_routers ()

Gets the list of available Zenoss API routers

Returns

Return type list

exception zenossapi.apiclient.**ZenossAPIClientAuthenticationError**

Bases: exceptions.Exception

exception zenossapi.apiclient.**ZenossAPIClientError**

Bases: exceptions.Exception

2.1 routers Base Class

class zenossapi.routers.ZenossRouter (*url, headers, ssl_verify, endpoint, action*)

Bases: object

Base class for Zenoss router classes

2.2 Device Router

Zenoss device_router

class zenossapi.routers.device.DeviceRouter (*url, headers, ssl_verify*)

Bases: *zenossapi.routers.ZenossRouter*

Class for interacting with the Zenoss device router

get_device_class (*device_class*)

Get a device class

Parameters *device_class* (*str*) – The name of the device class

Returns

Return type *ZenossDeviceClass*

get_tree (*device_class*)

Get the tree structure of a device class.

Parameters *device_class* (*str*) – Device class to use as the top of the tree

Returns

Return type dict

list_collectors ()

Get the list of collectors.

Returns**Return type** list**list_device_classes()**

Get the list of all device classes.

Returns**Return type** list**list_groups()**

Get the list of all groups.

Returns**Return type** list**list_locations()**

Get the list of all locations.

Returns**Return type** list**list_systems()**

Get the list of all systems.

Returns**Return type** list**class** zenossapi.routers.device.**ZenossComponent** (*url, headers, ssl_verify, device_data*)Bases: *zenossapi.routers.device.DeviceRouter*

Class for Zenoss component objects

delete()

Delete the component.

Returns Response message**Return type** str**lock** (*updates=False, deletion=False, send_event=False*)

Lock the component for changes.

Parameters

- **updates** (*bool*) – Lock for updates
- **deletion** (*bool*) – Lock for deletion
- **send_event** (*bool*) – Send an event when an action is blocked by locking

Returns Response message**Return type** str**lock_for_deletion** (*send_event=False*)

Lock the component for updates.

Parameters **send_event** (*bool*) – Send an event when deletion is blocked by locking**Returns** Response message**Return type** str

lock_for_updates (*send_event=False*)

Lock the component for updates.

Parameters **send_event** (*bool*) – Send an event when updates are blocked by locking

Returns Response message

Return type str

set_monitored (*monitor=True*)

Sets the monitored state for the component.

Parameters **monitor** (*bool*) – True to monitor, False to stop monitoring

Returns Response message

Return type str

class zenossapi.routers.device.**ZenossDevice** (*url, headers, ssl_verify, device_data*)

Bases: *zenossapi.routers.device.DeviceRouter*

Class for Zenoss device objects

add_local_template (*template*)

Add a local template to the device.

Parameters **template** (*str*) – Name of the new local template

bind_or_unbind_template (*path, template*)

Binds a template to the device if it's unbound, or unbinds it if it's bound.

Parameters

- **path** (*str*) – Template's path, as given in the display label
- **template** (*str*) – Name of the template to bind/unbind

delete (*action, del_events=False, del_perf=True*)

Remove a device from its organizer, or delete it from Zenoss altogether.

Parameters

- **action** (*str*) – 'remove' to remove the devices from their organizer, 'delete' to delete them from Zenoss
- **del_events** (*bool*) – Remove all events for the devices
- **del_perf** (*bool*) – Remove all perf data for the devices

Returns

Return type bool

delete_local_template (*template*)

Remove a local template from the device.

Parameters **template** (*str*) – Name of the template to remove

delete_property (*zproperty*)

Delete the locally set value of a property for a device

Parameters **zproperty** (*str*) – ID of the property to delete.

Returns

Return type bool

get_active_templates()

Get ZenossTemplate objects for all active templates on a device.

Returns

Return type list(*ZenossTemplate*)

get_bound_templates()

Get ZenossTemplate objects templates that are bound to the device.

Returns

Return type list(*ZenosTemplate*)

get_component(component)

Get a component object.

Parameters **component** (*str*) – Name of the component, e.g. 'hw/cpus/0'

Returns

Return type *ZenossComponent*

get_components(meta_type=None, start=0, limit=50, sort='name', dir='ASC')

Get component objects for all components on the device. Supports Pagination.

Parameters

- **meta_type** (*str*) – Meta type of components to list
- **start** (*int*) – Offset to start device list from, default 0
- **limit** (*int*) – The number of results to return, default 50
- **sort** (*str*) – Sort key for the list, default is 'name'
- **dir** (*str*) – Sort order, either 'ASC' or 'DESC', default is 'ASC'

Returns

Return type list(*ZenossComponent*)

get_custom_properties(params=None)

Get the cProperties for the device

Parameters **params** (*dict*) – Search parameters for filter the properties on.

Returns

```
{
    'total': Total count of properties returned.
    'properties': List of ZenossCustomProperty objects.
}
```

Return type dict(int, list(*ZenossCustomProperty*))

get_custom_property(cproperty)

Get a custom property for the device

Parameters **cproperty** (*str*) – ID of the property to get.

Returns

Return type *ZenossCustomProperty*

get_local_templates()

Get ZenossTemplate objects for all locally defined templates.

Returns**Return type** list(*ZenossTemplate*)**get_overridable_templates** ()

Get ZenossTemplate objects for templates that can be overridden.

Returns**Return type** list(*ZenossTemplate*)**get_properties** (*params=None*)

Get the configuration properties for the device

Parameters **params** (*dict*) – Search parameters for filter the properties on.**Returns**

```
{
    'total': Total count of properties returned.
    'properties': List of ZenossProperty objects.
}
```

Return type dict(int, list(*ZenossProperty*))**get_property** (*zproperty*)

Get a configuration property

Parameters **zproperty** (*str*) – The id of the property to get**Returns****Return type** *ZenossProperty***get_unbound_templates** ()

Get ZenossTemplate objects for available templates that are not bound to the device.

Returns**Return type** list(*ZenossTemplate*)**list_active_templates** ()

Get the list of templates active on a device, both bound and local.

Returns

```
{
    'name': Template name,
    'label': Display label for the template,
}
```

Return type list(dict(*str*, *str*))**list_bound_templates** ()

Get the list of templates bound to a device, does not include local templates.

Returns

```
{
    'name': Template name,
    'label': Display label for the template,
}
```

Return type list(dict(*str*, *str*))

list_components (*meta_type=None, start=0, limit=50, sort='name', dir='ASC', keys=None, name=None*)

Get a list of all the components on a device. Supports pagination.

Parameters

- **meta_type** (*str*) – Meta type of components to list
- **start** (*int*) – Offset to start device list from, default 0
- **limit** (*int*) – The number of results to return, default 50
- **sort** (*str*) – Sort key for the list, default is 'name'
- **dir** (*str*) – Sort order, either 'ASC' or 'DESC', default is 'ASC'
- **keys** (*list*) – Keys to include in the returned data
- **name** (*str*) – Regular expression pattern to filter on, requires the keys parameter

Returns

```
{
    'total': Total number of components found.
    'hash': Hash check to determine if components have changed
    'components': List of components found
}
```

Return type dict(int, str, list)

list_custom_properties ()

List the custom properties for the device

Returns

```
{
    'total': Total count of properties returned.
    'properties': List of properties found.
}
```

Return type dict(int, list(dict))

list_local_properties ()

List the locally defined configuration properties for the device

Returns

```
{
    'total': Total count of properties returned.
    'properties': List of properties found.
}
```

Return type dict(int, list(dict))

list_local_templates ()

Get the list of monitoring templates defined locally on a device.

Returns

Return type list

list_overridable_templates ()

Get the list of available templates on a device that can be overridden.

Returns

```
{
    'name': Template name,
    'label': Display label for the template,
}
```

Return type list(dict(str, str))

list_properties (*params=None, sort=None, sort_dir='ASC'*)

List the configuration properties for the device

Parameters

- **params** (*dict*) – Search parameters to filter the properties list on.
- **sort** (*str*) – Sort key for the properties list.
- **sort_dir** (*str*) – Sort direction, either ASC or DESC

Returns

```
{
    'total': Total count of properties returned.
    'properties': List of properties found.
}
```

Return type dict(int, list(dict))

list_unbound_templates ()

Get the list of available templates that are not bound to the device.

Returns

```
{
    'name': Template name,
    'label': Display label for the template,
}
```

Return type list(dict(str, str))

list_user_commands ()

Get the list of user commands for a device.

Returns

```
{
    name: Name of the user command
    description: Command description
}
```

Return type dict(str, str)

lock (*updates=False, deletion=False, send_event=False*)

Lock the device for changes.

Parameters

- **updates** (*bool*) – Lock for updates
- **deletion** (*bool*) – Lock for deletion
- **send_event** (*bool*) – Send an event when an action is blocked by locking

Returns Response message

Return type str

lock_for_deletion (*send_event=False*)

Lock the device for updates.

Parameters **send_event** (*bool*) – Send an event when deletion is blocked by locking

Returns Response message

Return type str

lock_for_updates (*send_event=False*)

Lock the device for updates.

Parameters **send_event** (*bool*) – Send an event when updates are blocked by locking

Returns Response message

Return type str

move (*device_class*)

Move the device to a different device class

Parameters **device_class** (*str*) – Name of the device class to move the device into

Returns uuid of the Job Manager job for the move

Return type str

reidentify (*new_id*)

Change the device's id in Zenoss. Note that changing the device id will cause the loss of all graph data for the device.

Parameters **new_id** (*str*) – New ID for the device

remodel ()

Remodel the device.

Returns uuid of the Job Manager job for the remodel

Return type str

reset_bound_templates ()

Remove all bound templates from device.

reset_ip_address (*ip_address=""*)

Reset the IP address of the device to ip_address if specified or to the result of a DNS lookup if not.

Parameters **ip_address** (*str*) – IP address to set device to

Returns Response message

Return type str

set_bound_templates (*templates*)

Set a list of templates as bound to a device.

Parameters **templates** (*list*) – List of template names

set_collector (*collector*)

Set the collector for the device.

Parameters **collector** (*str*) – The collector to use for the device

Returns uuid of the Job Manager job for the change

Return type str

set_priority (*priority*)

Set the priority for the device.

Parameters **priority** (*int*) – Numeric value for the desired priority

Returns Reponse message

Return type str

set_production_state (*production_state*)

Set the production state for the device.

Parameters **production_state** (*int*) – Numeric value for the desired production state.

Returns Response message

Return type str

set_property (*zproperty, value=None*)

Set the value of a configuration property

Parameters

- **zproperty** (*str*) – The id of the property to set a value for
- **value** (*str*) – The value to set for the property

Returns

Return type bool

class zenossapi.routers.device.**ZenossDeviceClass** (*url, headers, ssl_verify, device_class_data*)

Bases: [zenossapi.routers.device.DeviceRouter](#)

Class for Zenoss device class objects

add_device (*device_name, title="", ip_address="", location=None, systems=None, groups=None, model=False, collector='localhost', production_state=500, comments="", priority=3, snmp_community="", snmp_port=161, rack_slot="", hw_manufacturer="", hw_product_name="", os_manufacturer="", os_product_name="", asset_tag="", serial_number="", windows_user="", windows_password="", zcommand_user="", zcommand_password="", configuration_properties=None, custom_properties=None*)

Add a new device to the device class.

Parameters

- **device_name** (*str*) – Name of the new device, will be the device id
- **title** (*str*) – Optional title for the device, default is to match the device_name
- **ip_address** (*str*) – Ip address for the device, default is to derive this from DNS based on device_name
- **location** (*str*) – Location for the device
- **systems** (*list[str]*) – List of systems for the device
- **groups** (*list[str]*) – List of groups for the device
- **model** (*bool*) – Set to True to model the device automatically after creation
- **collector** (*str*) – Collector to use for the device
- **production_state** (*int*) – Numerical production state for the device, default is 500 (Pre-Production)
- **comments** (*str*) – Comments for the device

- **priority** (*int*) – Numerical priority for the device, default is 3 (Normal)
- **snmp_community** (*str*) – SNMP community string for the device
- **snmp_port** (*int*) – SNMP port for the device
- **rack_slot** (*str*) – Rack slot description
- **hw_manufacturer** (*str*) – Hardware manufacturer name, default is to derive by modeling
- **hw_product_name** (*str*) – Hardware product name, default is to derive by modeling
- **os_manufacturer** (*str*) – Operating system developer, default is to derive by modeling
- **os_product_name** (*str*) – Operating system name, default is to derive by modeling
- **asset_tag** (*str*) – Device’s inventory asset tag
- **serial_number** (*str*) – Device’s serial number
- **windows_user** (*str*) – Username for Windows device monitoring
- **windows_password** (*str*) – Password for the windows_user
- **zcommand_user** (*str*) – Username for SSH-based monitoring user
- **zcommand_password** (*str*) – Password for the zcommand_user
- **configuration_properties** (*dict*) – Key/value pairs for setting Configuration Properties for the device
- **custom_properties** (*dict*) – Key/value pairs for setting Custom Properties for the device

Returns ID of the add device job

Return type str

add_subclass (*name*, *description=""*, *connection_info=None*)

Add a new subclass to the device class.

Parameters

- **name** (*str*) – Name of the new subclass
- **description** (*str*) – Description for the new subclass
- **connection_info** (*list*) – zProperties that represent the credentials for access in the subclass

delete_property (*zproperty*)

Delete the locally set value of a property for a device class

Parameters **zproperty** (*str*) – ID of the property to delete.

Returns

Return type bool

get_custom_properties (*params=None*)

Get the cProperties for the device class

Parameters **params** (*dict*) – Search parameters for filter the properties on.

Returns

```
{
    'total': Total count of properties returned.
    'properties': List of ZenossCustomProperty objects.
}
```

Return type dict(int, list(*ZenossCustomProperty*))

get_custom_property (*cproperty*)

Get a custom property for the device class

Parameters **cproperty** (*str*) – ID of the property to get.

Returns

Return type *ZenossCustomProperty*

get_device (*device_name*)

Get a device from the device class

Parameters **device_name** (*str*) – The name of the device to get

Returns

Return type *ZenossDevice*

get_devices (*params=None, start=0, limit=50, sort='name', dir='ASC'*)

Get the devices contained in a device class. Supports pagination.

Parameters

- **params** (*dict*) – Key/value filters for the search, options are name, ipAddress, device-Class, or productionState
- **start** (*int*) – Offset to start device list from, default 0
- **limit** (*int*) – The number of results to return, default 50
- **sort** (*str*) – Sort key for the list, default is 'name'
- **dir** (*str*) – Sort order, either 'ASC' or 'DESC', default is 'ASC'

Returns

```
{
    'total': Total number of devices found
    'hash': Hashcheck to determine if any devices have changed,
    'devices': ZenossDevice objects,
}
```

Return type dict(int, str, list(*ZenossDevice*))

get_properties (*params=None*)

Get the configuration properties for the device class

Parameters **params** (*dict*) – Search parameters for filter the properties on.

Returns

```
{
    'total': Total count of properties returned.
    'properties': List of ZenossProperty objects.
}
```

Return type dict(int, list(*ZenossProperty*))

get_property (*zproperty*)

Get a configuration property

Parameters **zproperty** (*str*) – The id of the property to get

Returns

Return type *ZenossProperty*

list_custom_properties ()

List the custom properties for the device class

Returns

```
{
    'total': Total count of properties returned.
    'properties': List of properties found.
}
```

Return type dict(int, list(dict))

list_devices (*params=None, keys=None, start=0, limit=50, sort='name', dir='ASC'*)

List the devices contained in a device class. Supports pagination.

Parameters

- **params** (*dict*) – Key/value filters for the search, options are name, ipAddress, device-Class, or productionState
- **keys** (*list*) – List of keys to return for the devices found
- **start** (*int*) – Offset to start device list from, default 0
- **limit** (*int*) – The number of results to return, default 50
- **sort** (*str*) – Sort key for the list, default is 'name'
- **dir** (*str*) – Sort order, either 'ASC' or 'DESC', default is 'ASC'

Returns

Return type dict

list_local_properties ()

List the locally defined configuration properties for the device class

Returns

```
{
    'total': Total count of properties returned.
    'properties': List of properties found.
}
```

Return type dict(int, list(dict))

list_properties (*params=None, sort=None, sort_dir='ASC'*)

List the configuration properties for the device class

Parameters

- **params** (*dict*) – Search parameters to filter the properties list on.
- **sort** (*str*) – Sort key for the properties list.
- **sort_dir** (*str*) – Sort direction, either ASC or DESC

Returns

```
{
    'total': Total count of properties returned.
    'properties': List of properties found.
}
```

Return type dict(int, list(dict))**set_property** (*zproperty*, *value=None*)

Set the value of a configuration property

Parameters

- **zproperty** (*str*) – The id of the property to set a value for
- **value** (*str*) – The value to set for the property

Returns**Return type** bool

2.3 Events Router

Zenoss evconsole_router

class zenossapi.routers.events.**EventsRouter** (*url*, *headers*, *ssl_verify*)Bases: *zenossapi.routers.ZenossRouter*

Class for interacting with Zenoss events.

add_event (*summary*, *device*, *severity*, *component=None*, *event_class_key=None*,
event_class='/Status')

Create a new Zenoss event.

Parameters

- **summary** (*str*) – Summary for the new event
- **device** (*str*) – Device ID for the new event
- **component** (*str*) – Component UID for the new event
- **severity** (*str*) – Severity to assign the new event, must be one of Critical, Error, Warning, Info, Debug, or Clear
- **event_class_key** (*str*) – The Event Class Key to assign to the event
- **event_class** (*str*) – Event Class for the event

Returns**Return type** *ZenossEvent***clear_heartbeat** (*collector*, *daemon*)

Clear a heartbeat event for a specific daemon.

Parameters

- **collector** (*str*) – Collector the daemon is running in, e.g. slvcollector
- **daemon** (*str*) – Monitoring daemon to clear the heartbeat event for, e.g. zencommand

clear_heartbeats ()

Clear all heartbeat events

Returns True on success

Return type bool

get_config()

Get the event handling configuration.

Returns

Return type list(dict)

get_event_by_evid(evid)

Get an event by its event id

Parameters **evid** (*str*) – The event id

Returns

Return type *ZenossEvent*

get_open_events(limit=10, start=0, sort='lastTime', sort_dir='DESC')

Get all open events (new or acknowledged state)

Parameters

- **limit** (*int*) – Maximum number of events to return
- **start** (*int*) – Minimum index of events to get
- **sort** (*str*) – Sort key for events list
- **sort_dir** (*str*) – Sort direction, ASC or DESC

Returns

Return type list(*ZenossEvent*)

get_open_production_events(limit=10, start=0, sort='lastTime', sort_dir='DESC')

Get all open events (new or acknowledged state) for devices with a production state of Production

Parameters

- **limit** (*int*) – Maximum number of events to return
- **start** (*int*) – Minimum index of events to get
- **sort** (*str*) – Sort key for events list
- **sort_dir** (*str*) – Sort direction, ASC or DESC

Returns

Return type list(*ZenossEvent*)

list_open_events(limit=10, start=0, sort='lastTime', sort_dir='DESC')

Get a list of all open events (new or acknowledged state)

Parameters

- **limit** (*int*) – Maximum number of events to return
- **start** (*int*) – Minimum index of events to get
- **sort** (*str*) – Sort key for events list
- **sort_dir** (*str*) – Sort direction, ASC or DESC

Returns

Return type dict

list_open_production_events (*limit=10, start=0, sort='lastTime', sort_dir='DESC'*)

Get a list of all open events (new or acknowledged state) for devices with a production state of Production

Parameters

- **limit** (*int*) – Maximum number of events to return
- **start** (*int*) – Minimum index of events to get
- **sort** (*str*) – Sort key for events list
- **sort_dir** (*str*) – Sort direction, ASC or DESC

Returns

Return type dict

update_config (*config_values*)

Update the Zenoss event handling configuration.

Parameters **config_values** (*dict*) – Key/value pairs of the config values to change.

class zenossapi.routers.events.**ZenossEvent** (*url, headers, ssl_verify, event_data*)

Bases: *zenossapi.routers.events.EventsRouter*

Class for Zenoss event objects

ack ()

Acknowledge the event.

close ()

Close the event.

reopen ()

Reopen (unacknowledge or unclosed) the event.

update_log (*message*)

Add an entry to the event's log

Parameters **message** (*str*) – Log entry to add

2.4 Jobs Router

Zenoss jobs_router

class zenossapi.routers.jobs.**JobsRouter** (*url, headers, ssl_verify*)

Bases: *zenossapi.routers.ZenossRouter*

Class for interacting with the Zenoss device router

get_job (*job*)

Get a ZenossJob object by the job's uuid

Parameters **job** (*str*) – uuid of the job

Returns

Return type *ZenossJob*

get_jobs (*start=0, limit=50, sort='scheduled', dir='ASC'*)

Get ZenossJob objects for Job Manager jobs. Supports pagination.

Parameters

- **start** (*int*) – Offset to start device list from, default 0

- **limit** (*int*) – The number of results to return, default 50
- **sort** (*str*) – Sort key for the list, default is 'scheduled'. Other sort keys are 'started', 'finished', 'status', 'type' and 'user'
- **dir** (*str*) – Sort order, either 'ASC' or 'DESC', default is 'ASC'

Returns**Return type** list(*ZenossJob*)**list_jobs** (*start=0, limit=50, sort='scheduled', dir='DESC'*)

List all Job Manager jobs, supports pagination.

Parameters

- **start** (*int*) – Offset to start device list from, default 0
- **limit** (*int*) – The number of results to return, default 50
- **sort** (*str*) – Sort key for the list, default is 'scheduled'. Other sort keys are 'started', 'finished', 'status', 'type' and 'user'
- **dir** (*str*) – Sort order, either 'ASC' or 'DESC', default is 'DESC'

Returns

```
{
  'total': (int) Total number of jobs,
  'jobs': {
    'description': (str) Job description,
    'finished': (int) Time the job finished in timestamp format,
    'scheduled': (int) Time the job was scheduled in timestamp_
    ↪format,
    'started': (int) Time the job started in timestamp format,
    'status': (str) Status of the job,
    'type': (str) Job type,
    'uid': (str) JobManager UID - /zport/dmd/JobManager,
    'user': (str) User who scheduled the job,
    'uuid': (str) UUID of the job,
  }
}
```

Return type dict(int, dict(str, int, int, int, str, str, str, str, str))**class** zenossapi.routers.jobs.**ZenossJob** (*url, headers, ssl_verify, job_data*)Bases: *zenossapi.routers.jobs.JobsRouter*

Class for Zenoss job objects

abort ()

Abort the job.

Returns**Return type** bool**delete** ()

Delete the job.

Returns Job ID**Return type** list

get_log()

Get the log for the job.

Returns

```
{
    'logfile': Filesystem path of the log file,
    'maxLimit': True or False,
    'content': Log file lines
}
```

Return type dict(str, bool, list)

2.5 Monitor Router

Zenoss monitor_router

class zenossapi.routers.monitor.**MonitorRouter** (*url, headers, ssl_verify*)

Bases: *zenossapi.routers.ZenossRouter*

Class for interacting with the Zenoss monitor router

get_hub (*name*)

Get a ZenossHub object

Parameters **name** (*str*) – Name of the hub to get

Returns

Return type *ZenossHub*

get_hubs ()

Get the configured hubs as objects

Returns

Return type list(*ZenossHub*)

list_collectors ()

Returns the list of configured collectors

Returns

Return type list(dict)

list_hubs ()

Returns the list of configured zenhubs

Returns

Return type list(dict)

tree ()

Returns the full tree of hubs and collectors

Returns

Return type list(dict)

class zenossapi.routers.monitor.**ZenossCollector** (*url, headers, ssl_verify, collector_data, collector_params=None*)

Bases: *zenossapi.routers.monitor.MonitorRouter*

Class for Zenoss collector objects

class zenossapi.routers.monitor.ZenossHub (*url, headers, ssl_verify, hub_data*)

Bases: *zenossapi.routers.monitor.MonitorRouter*

Class for Zenoss hub objects

add_collector (*name, source=None, pool=None*)

Add a new collector to the hub.

Parameters

- **name** (*str*) – Name of the new collector
- **source** (*str*) – Name of the existing collector to use as a template
- **pool** (*str*) – The resource pool to place the collector in

Returns

Return type *ZenossCollector*

get_collector (*name*)

Get a ZenossCollector object

Parameters **name** (*str*) – Name of the collector to get

Returns

Return type *ZenossCollector*

get_collectors ()

Get the hub's collectors as objects.

Returns

Return type list(*ZenossCollector*)

2.6 Properties Router

Zenoss properties_router

class zenossapi.routers.properties.PropertiesRouter (*url, headers, ssl_verify*)

Bases: *zenossapi.routers.ZenossRouter*

Class for interacting with Zenoss properties.

delete_property (*uid, zproperty*)

Delete a ZenProperty.

Parameters

- **uid** (*str*) – UID to delete the property from
- **zproperty** (*str*) – ID of the property to delete.

Returns

Return type bool

get_custom_properties (*uid, params=None*)

Get ZenossCustomProperties objects for the cProperties of a uid context.

Parameters

- **uid** (*str*) – UID of the object to get properties for.
- **params** (*dict*) – Search parameters for filter the properties on.

Returns

```
{
    'total': Total count of properties returned.
    'properties': List of ZenossCustomProperty objects.
}
```

Return type dict(int, list(*ZenossCustomProperty*))**get_custom_property** (*uid*, *cproperty*)

Get a single ZenossCustomProperty

Parameters

- **uid** (*str*) – UID to get the property of.
- **cproperty** (*str*) – ID of the property to get.

Returns**Return type** *ZenossCustomProperty***get_local_properties** (*uid*)

Get ZenossProperty objects for the local properties of a specified uid.

Parameters **uid** (*str*) – UID to get local properties for.**Returns**

```
{
    'total': Total count of properties returned.
    'properties': List of ZenossProperty objects.
}
```

Return type dict(int, list(*ZenossProperty*))**get_properties** (*uid*, *params=None*)

Get ZenossProperties objects for the properties of a uid context.

Parameters

- **uid** (*str*) – UID of the object to get properties for.
- **params** (*dict*) – Search parameters for filter the properties on.

Returns

```
{
    'total': Total count of properties returned.
    'properties': List of ZenossProperty objects.
}
```

Return type dict(int, list(*ZenossProperty*))**get_property** (*uid*, *zproperty*)

Get a single ZenossProperty

Parameters

- **uid** (*str*) – UID to get the property of.
- **zproperty** (*str*) – ID of the property to get.

Returns**Return type** *ZenossProperty*

list_custom_properties (*uid*, *params=None*, *sort=None*, *sort_dir='ASC'*)

Get a list of cProperties for the uid context.

Parameters

- **uid** (*str*) – UID of the object to list properties for.
- **params** (*dict*) – Search parameters to filter the properties list on.
- **sort** (*str*) – Sort key for the properties list.
- **sort_dir** (*str*) – Sort direction, either ASC or DESC

Returns

```
{
    'total': Total count of properties returned.
    'properties': List of properties found.
}
```

Return type dict(int, list(dict))

list_local_properties (*uid*)

Get a list of properties set locally to the specified UID.

Parameters **uid** (*str*) – UID to get local properties for.

Returns

```
{
    'total': Total count of properties returned.
    'properties': List of properties found.
}
```

Return type dict(int, list(dict))

list_properties (*uid*, *params=None*, *sort=None*, *sort_dir='ASC'*)

Get a list of ZenProperties for the uid context.

Parameters

- **uid** (*str*) – UID of the object to list properties for.
- **params** (*dict*) – Search parameters to filter the properties list on.
- **sort** (*str*) – Sort key for the properties list.
- **sort_dir** (*str*) – Sort direction, either ASC or DESC

Returns

```
{
    'total': Total count of properties returned.
    'properties': List of properties found.
}
```

Return type dict(int, list(dict))

set_property_value (*uid*, *zproperty*, *value=None*)

Sets (or updates) the local value of a property

Parameters **value** – The new value for the property, type varies by property.

Returns

Return type bool

class zenossapi.routers.properties.**ZenossCustomProperty** (*url, headers, ssl_verify, property_data*)

Bases: *zenossapi.routers.properties.PropertiesRouter*

Class for Zenoss CustomProperties

delete ()

Delete the local instance of a property.

Returns

Return type bool

set_value (*path=None, value=None*)

Sets (or updates) the local value of a custom property

Parameters

- **path** (*str*) – UID of the node to set the property for.
- **value** (*str*) – The new value for the property, type varies by property.

Returns

Return type bool

class zenossapi.routers.properties.**ZenossProperty** (*url, headers, ssl_verify, property_data*)

Bases: *zenossapi.routers.properties.PropertiesRouter*

Class for ZenProperties

delete ()

Delete the local instance of a property.

Returns

Return type bool

set_value (*path=None, value=None*)

Sets (or updates) the local value of a property

Parameters

- **path** (*str*) – UID of the node to set the property for.
- **value** (*str*) – The new value for the property, type varies by property.

Returns

Return type bool

2.7 Template Router

Zenoss template_router

class zenossapi.routers.template.**TemplateRouter** (*url, headers, ssl_verify*)

Bases: *zenossapi.routers.ZenossRouter*

Class for interacting with the Zenoss template router

add_data_point_to_graph (*datapoint, graph, include_thresholds=False*)

Adds a data point to a graph.

Parameters

- **datapoint** (*str*) – Uid of the data point to add
- **graph** (*str*) – Uid of the graph to add the data point to
- **include_thresholds** (*bool*) – Set to True to include the related thresholds for the data point

Returns**Return type** dict**add_local_template** (*zenoss_object*, *name*)

Adds a local template to an object.

Parameters

- **zenoss_object** (*str*) – Uid of the object to add the local template to
- **name** – Unique name for the new local template

add_template (*target*, *name*)

Adds a template to a device class.

Parameters

- **target** (*str*) – The uid of the target device class
- **name** (*str*) – Unique name of the template to add

Returns**Return type** *ZenossTemplate***delete_local_template** (*zenoss_object*, *name*)

Builds the request data for deleting a local template to an object.

Parameters

- **object** (*str*) – Uid of the object to remove the local template from
- **name** – Unique name of the new local template

delete_template (*device_class*, *template*)

Removes a template.

Parameters

- **device_class** (*str*) – Name of the device class where the template is defined
- **template** (*str*) – Name of the template to remove

Returns**Return type** dict**get_all_templates** ()

Returns all defined templates.

Returns**Return type** list(*ZenossTemplate*)**get_data_source_types** ()

Gets the list of available data source types.

Returns**Return type** list

get_device_class_templates (*device_class*)

Gets the defined templates for a device class

Parameters **device_class** (*str*) – Device class to get templates for

Returns

Return type list(*ZenossTemplate*)

get_object_templates (*zenoss_object*)

Gets the templates bound to a specific object (monitored resource or component)

Parameters **zenoss_object** (*str*) – The uid of the object, e.g. Devices/Server/Zuora/Aspose/devices/10.aspose.prod.slv.zuora

Returns

Return type list(*ZenossTemplate*)

get_template (*device_class*, *template*)

Get a Zenoss template

Parameters

- **device_class** (*str*) – Name of the device class where the template is defined
- **template** (*str*) – Name of the template to get

Returns

Return type *ZenossTemplate*

get_threshold_types ()

Gets the list of available threshold types.

Returns

Return type list

list_all_templates ()

Returns all defined templates as a list of tuples containing the template UID and description.

Returns

Return type list(*ZenossTemplate*)

list_device_class_templates (*device_class*)

Returns the defined templates for a device class as a list of tuples containing the template UID and description.

Parameters **device_class** (*str*) – Device class to list templates for

Returns

Return type list(str)

set_properties (*properties*)

Sets properties of an object.

Parameters **properties** (*dict*) – Properties and values to set

class zenossapi.routers.template.**ZenossDataPoint** (*url*, *headers*, *ssl_verify*, *dp_data*)

Bases: *zenossapi.routers.template.TemplateRouter*

Class for Zenoss data points

add_to_graph (*graph*, *include_thresholds=False*)

Adds a data point to a graph.

Parameters

- **graph** (*str*) – Name of the graph to add the data point to
- **include_thresholds** (*bool*) – Set to True to include the related thresholds for the data point

Returns**Return type** dict**delete()**

Deletes a data point from a template.

Returns**Return type** dict**make_counter()**

Sets the RRD Type of the data point to COUNTER

Returns**Return type** bool**make_gauge()**

Sets the RRD Type of the data point to GAUGE

Returns**Return type** bool**set_threshold(threshold, threshold_type)**

Adds a threshold for the data point

Parameters

- **threshold** (*str*) – Name of the threshold to add
- **threshold_type** (*str*) – Type of the new threshold, must be one of the types returned by `get_threshold_types()`

Returns**Return type** *ZenossThreshold***class** zenossapi.routers.template.**ZenossDataSource** (*url, headers, ssl_verify, ds_data*)Bases: *zenossapi.routers.template.TemplateRouter*

Class for Zenoss template data sources

add_data_point(datapoint)

Adds a data point to a data source.

Parameters **datapoint** (*str*) – Name of the new data point**Returns****Return type** *ZenossDataPoint***delete()**

Deletes a data source from a template.

Returns**Return type** dict

delete_data_point (*datapoint*)

Deletes a data point from a template.

Parameters **datapoint** (*str*) – Name of the data point to remove

Returns

Return type dict

get_data_point (*datapoint*)

Get a particular data point.

Parameters **datapoint** (*str*) – Name of the data point to get details for

Returns

Return type *ZenossDataPoint*

get_data_points ()

Get all the data points for a datasource.

Returns

Return type list(*ZenossDataPoint*)

list_data_points ()

Returns all the data points for a datasource as a list.

Returns

Return type list(str)

class zenossapi.routers.template.**ZenossGraph** (*url, headers, ssl_verify, graph_data*)

Bases: *zenossapi.routers.template.TemplateRouter*

Class for Zenoss graphs

add_graph_threshold (*threshold*)

Adds a threshold to a graph.

Parameters **threshold** (*str*) – Uid of the threshold to add

Returns

Return type dict

add_point (*datasource, datapoint, include_thresholds=False*)

Adds a data point to a graph.

Parameters

- **datasource** (*str*) – Name of the data source holding the data point
- **datapoint** (*str*) – Name of the data point to add
- **include_thresholds** (*bool*) – Set to True to include the related thresholds for the data point

Returns

Return type dict

delete_point (*datapoint*)

Deletes a data point from a graph.

Parameters **datapoint** (*str*) – Name of the data point to remove

Returns

Return type dict

get_points()

Gets the data points of a graph.

Returns

Return type list(*ZenossDataPoint*)

list_points()

Returns the data points of a graph as a list.

Returns

Return type list(str)

set_graph_properties(properties)

Set the properties for a graph.

Parameters **properties** (*dict*) – Properties and values to set

Returns

Return type dict

set_point_sequence(datapoints)

Sets the order of data points in a graph.

Parameters **datapoints** (*list*) – List of data point names in the desired order

Returns

Return type dict

set_zero_baseline()

Set the minimum value of a graph display to zero. By default Zenoss graph scale is dynamic, meaning the display can be skewed because the minimum value isn't fixed.

class zenossapi.routers.template.**ZenossTemplate**(*url, headers, ssl_verify, template_data*)

Bases: *zenossapi.routers.template.TemplateRouter*

Class for Zenoss Template objects

add_data_source(datasource, type)

Adds a data source to a template.

Parameters

- **datasource** (*str*) – Name of the new data source
- **type** (*str*) – Type of the new data source, must be one of the types returned by `get_data_source_types()`

Returns

Return type *ZenossDataSource*

add_graph(graph)

Add a new graph to a template.

Parameters **graph** (*str*) – Name for the new graph

Returns

Return type *ZenossGraph*

add_threshold (*threshold*, *threshold_type*, *datapoints*)

Adds a threshold to a template.

Parameters

- **threshold** (*str*) – Name of the new threshold
- **threshold_type** (*str*) – Type of the new threshold, must be one of the types returned by `get_threshold_types()`
- **datapoints** (*list*) – List of datapoints to select for the threshold

Returns

Return type *ZenossThreshold*

copy (*target*)

Copy a template to another device or device class.

Parameters **target** (*str*) – Uid of the device or device class to copy to

Returns

Return type *ZenossTemplate*

delete ()

Removes a template.

Returns

Return type dict

delete_data_source (*datasource*)

Deletes a data source from a template.

Parameters **datasource** (*str*) – Name the data source to remove

Returns

Return type dict

delete_threshold (*threshold*)

Deletes a threshold.

Parameters **threshold** (*str*) – Name of the threshold to remove

Returns

Return type dict

get_data_points ()

Get all the data points in a template.

Returns

Return type list(*ZenossDataPoint*)

get_data_source (*datasource*)

Get a particular data source.

Parameters **datasource** (*str*) – Name of the data source to get

Returns

Return type *ZenossDataSource*

get_data_sources ()

Gets data sources configured for a template.

Returns**Return type** list(*ZenossDataSource*)**get_graph** (*graph*)

Get a particular graph.

Parameters **graph** (*str*) – Name of the graph to get the definition of**Returns****Return type** *ZenossGraph***get_graphs** ()

Get the graphs defined for a template.

Returns**Return type** list(*ZenossGraph*)**get_threshold** (*threshold*)

Get a particular threshold.

Parameters **threshold** (*str*) – Name of the threshold to get details on**Returns****Return type** *ZenossThreshold***get_thresholds** ()

Gets the thresholds of a template.

Returns**Return type** list(*ZenossThresholds*)**list_data_points** ()

Returns all the data points in a template as a list.

Returns**Return type** list(str)**list_data_sources** ()

Returns data sources configured for a template as a list.

Returns**Return type** list(str)**list_graphs** ()

Returns the graphs defined for a template as a list.

Returns**Return type** list(str)**list_thresholds** ()

Returns the thresholds of a template as a list.

Returns**Return type** list(str)**class** zenossapi.routers.template.**ZenossThreshold** (*url*, *headers*, *ssl_verify*, *threshold_data*)Bases: *zenossapi.routers.template.TemplateRouter*

Class for Zenoss thresholds

delete()

Deletes a threshold.

Returns

Return type dict

set_max(*maxval*)

Sets the threshold value for a MinMaxThreshold checking the max value of a data point.

Parameters **maxval** (*str*) – Maximum value for the data point before alerting

Returns

Return type bool

set_min(*minval*)

Sets the threshold value for a MinMaxThreshold checking the minimum value of a data point.

Parameters **minval** (*str*) – Minimum value for the data point before alerting

Returns

Return type bool
